

Arable farming storage manager

The STORAGE MANAGER from SERCOM is the ideal support for the drying, conditioning and storage of your arable farm products. With one central computer you can manage any drying and/or storage situation.

Status reports for all controls

Overview of all running and waiting periods

Settings are saved for each product treatment

Automatic spill-over of treatments

Quiet, freely adjustable humidity control

Different cooling down strategies

CO₂-ventilation control

User-friendly controls

The controls are available in two versions: LCD and PC. The large, easily visible display of the LCD control unit provides all essential information at one glance. With the PC control unit with Sercovision, graphs can be used to review what the values of earlier measurements were, which greatly simplifies the analysis of the storage results.

Energy-saving

Energy management is fully integrated in all controls. Wherever possible, depending on the conditions, maximum use will be made of the outside air to minimise the energy bill for the use of cooling and heating. The controls also take peak and off-peak rates into account and run all of the equipment at their economic optimum level.

Arable farming storage manager

GRIMME

Quality increase

There are specific programmes available for each treatment period. In one complete overview you can see immediately whether everything is working as it should and why it isn't working as expected. Modern insights and developments using natural gasses help you to maintain the quality of your products.

Long lifespan

The computer is suitable for both small and large storage systems. The hardware and the software have a modular design, which allows expansion at any time in the future without great expense. Thirty-year-old storage computers from SERCOM are still running and were recently expanded.
